December 2010

An O.I.C. Specialty Laboratory *Occlusion - Implant - Cosmetic*

T&S Certified Lab

How can something be so strong yet be invisible at the same time?

Finally, a breakthrough in denture reinforcement.

You can now reinforce a new prosthesis or repair an existing one and be assured it won't come back to haunt you.

The secret lies in a revolutionary new material known as Perma Fiber and Perma Mesh. Unlike non-bonding materials such as metal mesh, which actually create thinner and weaker layers of acrylic, Perma Fiber and Perma Mesh actually bond to resin so they become an integral part of the material and final prosthesis. Perma Fiber and Perma Mesh are used to repair full and partial dentures, can be incorporated into potentially weak areas of a new prosthesis such as a "flipper" tooth or in any instance where denture acrylic needs reinforcement.

Fracture line prepared with
cut pieces to be inserted

Fibers are invisible in
the final prosthesis

What are the advantages of Perma Fiber and Perma Mesh?

- Strength (glass fibers and bonding!)
- Easy to grind and finish...stop breakage where it starts
- Smooth finish allows for superior hygiene, as bacteria adheres poorly to smooth surfaces
- Two types of materials—fiber & mesh
- It is the only reinforcement materials that acrylic resin will fill thoroughly and bond to
- Great aesthetics. Materials are translucent when wetted
- Allows for a smooth finish eliminating a rough surface that can irritate

With over 12 years of research, along with 600 clinical cases in collaboration with both foreign and domestic universities, Perma Fiber and Perma Mesh are scientifically proven solutions.

Holiday Closings 2010 / 2011

The lab will be closed for seasonal holidays from
December 27th, 2010 to December 31st, 2010
We will re-open January 3rd, 2011

All of us at Klausz Dental Laboratory would like to
wish you a very happy and healthy holiday season.
