Let's Stop Wasting Chair Time... With Our Exclusive Bite Equilibration Technique!

In a poll of dental offices, the number one complaint with fixed restorations, be it porcelain fused to metal, all ceramic, or polymer glass is the excessive time loss associated with adjusting the occlusion or even having to grind in the bites.

We've found a solution that has proven itself over time. With our exclusive **Bite Equilibration Technique**, we have been able to successfully eliminate approximately 95% of all chair side adjustments.

The technique consists of eliminating all bubbles from the occluding surfaces and with fine articulating paper, looking for high spots in occlusion and then eliminating them until more stable contact markings appear. Now the mounted models more accurately represent the patient's occlusion.

We are so confident that we can start saving you time, I personally guarantee it. How can I be so sure? Because we have been helping many of your colleagues do just that.

If you are interested in finding out how you can benefit from this technique, just give me a call and I will be pleased to send you more information. Better yet, send us a case and we'll prove it to you. The sooner you call, the sooner you can stop adjusting bites and start working more efficiently.

Ronald Klausz, R.D.T.
